

Importing a partial job using hot folders

1. Start with an existing job.
2. Create a hot folder for the job, and link it to an ImportIncremental type of import process template.
3. Using a file browser, drop the partial export .zip file into the hot folder.

Prinerger imports the partial job into the existing job. If an imported signature has the same name as an existing signature, Prinerger adds a suffix of "01" to the imported signature.
