

Linking refined pages to the versioned pages

Linking is performed after the version plan is created. Linking associates a refined page to the appropriate layer of a versioned page. This is how Prinergy knows from which file to extract content for a layer.

LPV jobs can have a mix of versioned pages and non-versioned pages.

The following table shows how refined pages must be linked to different layers of versioned page 1 in the retail catalog scenario:

The Refined Page	Is Linked to the
Eng_1.p1.pdf (In this scenario, because all refined pages contain the image content, any one of them can be linked to the common layer)	common layer
West.p1.pdf	West layer
East.p1.pdf	East layer
Esp_1.p1.pdf	Esp layer
Eng_1.p1.pdf	Eng layer

Versioned Page One

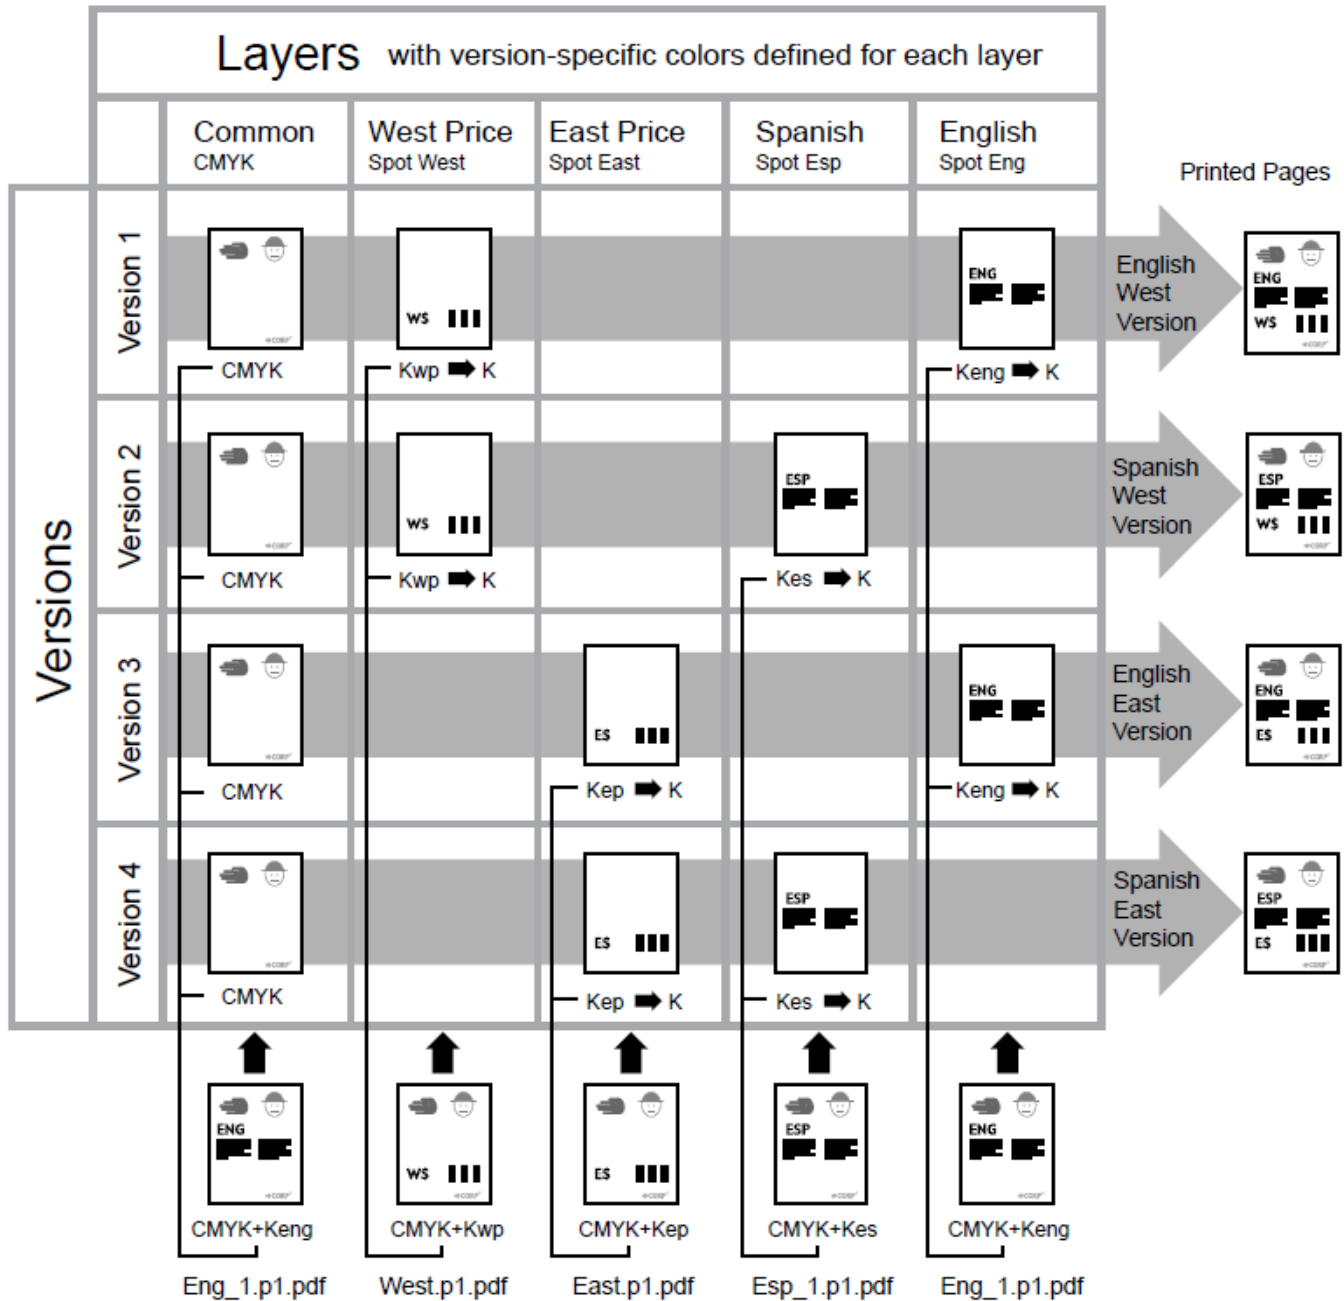

Figure 1. Example of versioned page one, containing all required layers and contributing pages for all versions of page 1

Note: The refined pages in this example represent input file model 1.
