

Category 1

Input files of category 1 models are non-layered input files, and each contains the entire contents (base and change content) for one or more versions.

The following illustrations assume that you have one base.

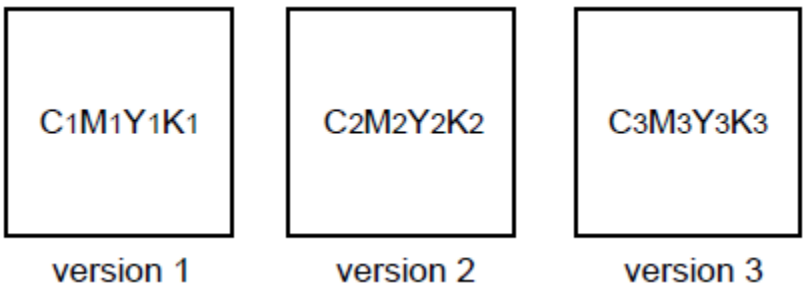

Model 1: [Cc, Mc, Yc, Kc, S]ⁿ

For each version, provide a single input file that contains a mix of base and change content, where the change content is defined as a spot color.

Model 2: [C, M, Y, K]ⁿ

For each version, provide a single input file that contains a mix of base and change content, where all content is in process color. The change content is not identified by color. However, the operator must know which colors contain change content.

Model 3: [Cc, Mc, Yc, Kc + Sⁿ]

For all versions, provide a single input file that contains base and change content, where each version's content is defined with a different spot color.
