

Range box in the Link to Layers dialog box

When using the Link to Layers dialog box, note that you can use the **Range** box to link:

- **Each contributing page to a single versioned page—specifying each versioned page**

For example: **1, 3, 6**

This links the first selected contributing page to versioned page 1, the second selected contributing page to versioned page 3, and the third selected contributing page to versioned page 6.

- **Each contributing page to a single versioned page—identifying the versioned pages as a range**

For example **1-3, 6**

This links the first selected contributing page to versioned page 1, the second selected contributing page to versioned page 2, the third selected contributing page to versioned page 3, and the fourth selected contributing page to versioned page 6.

Note: This syntax does not create versioned pages. For example, if versioned page 2 does not exist, it is not created. If versioned page 2 does not exist, then, the example would link the first contributing page to versioned page 1, the second contributing page to versioned page 3, and the third contributing page to versioned page 6.

- **Each contributing page to multiple versioned pages—using parentheses**

For example **(1,3), 6**

This links the first contributing page to versioned pages 1 and 3; and links the second contributing page to versioned page 6.

For example **(1-3), 6**

This links the first contributing page to versioned pages 1, 2, and 3; and links the second contributing page to versioned page 6.
