

Ungenerate

The new to 9.5 option 'Ungenerate' is useful for resetting VP Geometry.

The Geometry set on the component pages, is used when you Generate (meaning you can see the results in the VP PDF that is created)

The Geometry set on the VP page is used on Output (meaning you can see the results on the Imposition)

In 9.5 we have made it more clear, as to when and to what (Version Page or Component Page) Geometry will be applied

VP and CP now has 2 status':

Status 1: Before Generate

Version Page geometry is unavailable and the visible columns will have an NA status

Geometry can be set to the Component pages, and the changes will be applied to the VP PDF during Generate

Status 2: After Generate:

Component pages geometry is unavailable and the visible columns will have an NA status

Version Page geometry is available and changes made will be applied on Output

Right Click a Generated VP and choose **Ungenerate** and your VP will return to Status 1

Notes:

As of 9.5, you can apply Scaling and Rotation to the component pages.

Changing Scale and Rotate Geometry on pages linked to base layer is not supported

By default we rotate the page using the lower left corner axis. However, there is also registry value to change this to use a centre rotation axis
