

Overview of outputting an LPV job

This section describes the options and considerations for outputting Layered PDF Versioning (LPV) jobs that are in addition to those options and considerations for outputting non-LPV jobs.

Note: You can decide not to print error layers/versions even if they are selected for output. To do so, in the loose page output, imposition output, or final output process template, in the **Render** section, select the **Restrict output of layers/versions with errors** check box.

Tip: The procedures in this guide describe how to perform tasks using the menu bar. However, you can also quickly access many menu items using the context menu by right-clicking inside the Workshop window.

For general information about how to create proofs and final output, and how to start a process, see the relevant topics in this guide.
