

Outputting PDF vector files

For information about PDF vector files, see [About supported output formats](#).

When outputting to PDF vector files, ensure that:

- You select the **Preserve PDF Layers** check box in the **File Format** section of the process template if you want to preserve PDF 1.5 layers. This prevents the file from writing as a PDF 1.3 file, in which the layers are flattened.
- You select the required **Document Format** option (**Multipage** or **Single Page**) in the **File Format** section.
- Output file names will be unique.

Note: Prinergy does not support vector PDF imposition proofs with preserved PDF layers on surfaces with multiple versions.
