

# Outputting versioned separations

In a legacy versioning job, the separations for a versioned imposition have three labels: **Base**, **Common**, and **Unique**.  
For a description of these labels, see **Common** in the [Visible Columns dialog box in Separations view](#) topic. You can view these labels in the **Common** column in the **Separations** view in Job Manager. See [Displaying and hiding columns](#).

- 1. In Job Manager, in the **Separations** view, select a signature.
- 2. From the **Job** menu, select **Identify Common Separations**.
- 3. In the **Common** column, perform one of the following actions:

| To Output This             | Do This                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| Without common separations | Select the separations labelled <b>Base</b> and <b>Unique</b> , and clear the separations labelled <b>Common</b> . |
| Only common separations    | Select the separations labelled <b>Common</b> that you want to output.                                             |

**Note:** The separations labelled **Common** are grayed-out to help you locate them.

You are ready to generate output.

**Tip:** You can also control whether output has common separations while you generate the output. When you start an output process template, a warning dialog box asks you to confirm that you want to output the common separations.
