

Exporting jobs from the EPM Server

Before switching the EPM server back to operating as a secondary server, export any jobs that were processed during failover mode.

In EPM mode, the EPM server uses a database that is physically independent from the original primary server. Any jobs that were processed while the EPM server was operating as the primary server are lost when you revert to the original primary server. If you want to keep the jobs, export them before reverting the EPM server to its normal configuration.

On the EPM server, open Prinergy Workshop and select **File > Export Job**.
