

Reverting the EPM server to secondary mode

Stop all Prinergy workflow so that you can cancel the EPM server's role as the failover primary server and allow it to resume its secondary role.

- Jobs that were processed during failover mode must have been exported.
 - The Prinergy server must be connected to the network.
1. Start Prinergy Administrator on the EPM server, and stop the Prinergy software on all servers (**File > Stop Prinergy**).
 2. In Prinergy Administrator on the EPM server, set the EPM server back to secondary mode: **File > Revert to Secondary**.

The EPM server immediately becomes a secondary server.
