

What's new

The Prinergy VPS 3.0 software includes these new features:

Rotating an image in 90 degree increments

You can now rotate an image by 90 degrees to the left or right using the **Rotate Left** or **Rotate Right** icons in the toolbar. This is helpful when you view jobs that are set to utilize optimum space. As well, you can now set your preferences so that when a job is opened, the image is automatically rotated into an upright position.

Densitometer tool

The **Densitometer** tool measures the ink density at any given point or over any given region. When this tool is active, the ink density of the pixel directly below the tip of the **Densitometer** tool appears in the **Separations** palette. Draw a marquee with this tool and ink density readings for the corresponding pixels of the given rectangular area display in the **Separations** palette. Click outside the marquee and the **Densitometer** tool returns to measuring the ink density of individual pixels again.

Ink saver

The ink saver feature displays the percentages of ink coverage that will be required per press sheet.

Type safety edges

The type safety (safe protect) box can now be displayed along with other imposition information when this information is available in the preview files.
