

Opening files

The Prinerger VPS software will open preview files that have the file name extension .VPS or .PRV and are produced by Prinerger or iMPAct systems.

Prinerger VPS will also open high-resolution TIFF files with a file name extension of .TIF as long as they conform internally to the structure of a preview file, that is, they were created using a process template in Prinerger set to output to **Virtual Proof** for Prinerger or via AllegroTIFF for iMPAct.
