

Checking versioned files

The features described in this section are only visible when the Prinergy VPS software opens preview files that were created with the Prinergy Layered PDF Versioning (LPV) option. LPV was introduced in Prinergy 3.0.2 and allows operators to create version plans and generate PDF files to output plates unique to various versions of a print run.

The following aids are available to help you preview versioned files:

- Job Browser dialog box
- Displaying the preview file name for a separation
- Previewing version and common files for a versioned job
- Getting information about a versioned job
