

Setting page geometry

You can add page geometry settings to PDF pages in several ways:

- Let Prinergy automatically apply offsets from registration marks included in PostScript generated from Adobe InDesign software, Adobe PageMaker software, and QuarkXPress software files, or from the TrimBox geometry of source PDF files. This option is preferable when files already have correct geometry.
- Use the Set Page Geometry dialog box in Prinergy Workshop to control trim size, offset, scale, and orientation. Use this method when you know the measurements that you want to apply.
- Use Prinergy Geometry Editor, a Kodak plug-in to Acrobat that lets you visually set the trim size for a page.
- Use an APA file to automatically set page geometry at the end of the refining process.

To set page geometry:

1. In the **Pages** pane of the **Pages** or **Signatures** view, select a page.
2. From the **Edit** menu, select **Set Page Geometry**.
