

Configuring the Websocket server application

MatchprintVirtual-SmartReview is a Websocket server running in the background as an agent application on the Mac. When Matchprint Virtual is installed, this component is automatically installed. It works with Smart Review in InSite Creative Workflow for color accuracy.

- The Websocket server runs automatically when you log on to Mac OS.
- The icon for the MV agent application appears at the top-right corner on the status bar of the operating system.
- You can run or stop the Websocket server, but it is strongly recommended that you do not stop the server unless you are advised to do so by your Kodak service representative.

1. To quit MatchprintVirtual-SmartReview, click **Open Application**.
The application appears in the foreground.
2. Click the log window that appears.
3. Select MatchprintVirtual-SmartReview and click **Quit MV_Review**.
4. While it is not recommended to switch users on Mac, you need to add the MatchprintVirtual-SmartReview application as an item that opens automatically when you log on for additional users:

Note: These steps are only required for additional users that share the Mac. The Websocket application will already be configured to open at logon for the Admin user that installs Matchprint Virtual.

- a. Select **Apple > System Preferences**.
- b. Click **Users & Groups**.
- c. Click the account whose settings you want to change.
- d. Click **Login Items**.
- e. Click **+**.
- f. Browse to Applications\Matchprint Virtual\MVP Shell
App\Tools\MatchprintVirtual-SmartReview and click **Add**.
- g. Click the lock icon to prevent additional changes to the settings.
- h. Close the Users & Groups window.
