**Prinerger VPS+** is software that displays pages (artworks) and imposition (layouts) as screened one-bit raster on your monitor. You can save time and money by using Prinerger VPS+ software to find errors before proofs or plates are made.

Use Prinerger VPS+ software in **Commercial Mode** to check publication impositions/layouts, page positions, registration, layered PDF versioning, trapping, backup, fonts, image placement, and color breaks.

Kodak VPS+ software also has a **Packaging Mode** that provides optimized tools for arranging 1-bit TIFF files in layouts for flexo platemaking. Design plate layouts with specified output settings, and drag image files directly to the layouts or use hot folders for automated processing and output of flexo layouts. Users can optionally output cutting information for cutting tables in EPS or ACM format. VPS+ Packaging Mode also provides a complete set of reformatting tools for raster files, such as the ability to descreen a file or to change its resolution.
