

Commercial Mode vs Packaging Mode

Kodak Prinergy **VPS+** provides **two different modes** of operation, **Commercial** and **Packaging**, to suit different quality control and production requirements. Which Menu items and which Toolbar Icons are visible depends on which mode you are in.

Modes can be switched in **Preferences**.

To access Preferences, (Mac) select the **Prinergy VPS+ > Preferences...** menu or press keyboard shortcut **CMD+", "** or (Windows) select **Edit > Preferences...** menu or press **Shift+p**.

Commercial Mode is the default User Mode and provides a simplified interface familiar to VPS Classic users. **Commercial mode** is primarily for viewing impositions for commercial offset quality control. Only Commercial Mode allows front and back viewing of impositions/layouts, with an ability to view imposition information, page edges, page numbers and type safety areas,

Packaging Mode is primarily for creation of flexographic plate layouts, and also provides a host of additional tools for proofing and reformatting VPS, LEN and TIFF files.

VPS and TIFF files can be recalibrated, descreened, scaled or combined into a raster PDF for import into step-and-repeat applications like Pandora.

All operations can be automated by use of Hot Folders.

There are additional features for creating and viewing seamless layouts for in-the-round or plate-on-sleeve imaging, and features for creating slug-based layouts for corrugated flexo printing.
