

VPS+ Reusing a job plan (Packaging mode)

A job plan consists of the parameters of the layout of the corrugated job, the selected job planning preset (including carrier area, first-to knife line and the cost and time it takes to plan and create the job for output), the slugs, and registration marks. When you finish planning such a job, you save it as a job planning file (with a .p1n file name extension). This job plan can be used later for a different corrugated job with the same requirements.

1. On the toolbar, click **Open**.
2. In the Open dialog box, browse to the job plan (with a .p1n file name extension) that you want to open, select it, and click **Open**.
