

Rotating a file in Compare mode

When comparing images of different orientations in Compare mode, use the Rotate feature to rotate only one image. This is useful when you are comparing two files that are identical except for their image orientations.

1. While in Compare mode, click the arrow next to the **Compare View** button and in the list that appears, clear the **Synchronize View** option.
2. Click the image that you want to rotate.
The file name is highlighted in blue to indicate that one file is selected.
3. Click the Rotate button and from the list that appears, select **90° clockwise**, **90° counter clockwise**, or **180°** to rotate the file.
