

Checking for color accuracy

You can check the color accuracy and calibration status of your monitor in Smart Review. When you open a file in Smart Review, the image is rendered according to the color target that

is assigned to the file. The **MV Indicator** icon, , in the view and zoom tools area of the Smart Review window displays the Matchprint Virtual calibration profile in use and provides information about whether you are using a monitor that meets the necessary requirements for

Matchprint Virtual and is calibrated. The **color target** icon, , that appears under the **MV Indicator** icon, displays the color target that is in use and indicates if any spot color is not found in the color database. If you are not using a monitor that meets the necessary requirements for Matchprint Virtual, you can open the file and annotate it in Smart Review, but you cannot perform color approval.
