

Recommended monitor vendors

Before you purchase a monitor, it is important to review all specifications provided by the manufacturer to ensure that the display supports Adobe RGB or sRGB color gamut and is a flat panel.

Kodak has only tested Matchprint Virtual with EIZO CG and CS series displays. If you choose to use a monitor from another manufacturer, it must conform to the same noted [Requirements](#).

Note:

- Make sure that new EIZO displays* that are introduced to the market have been reviewed by Kodak prior to purchase. Not all models in a series will necessarily be supported. If you are planning to purchase a new EIZO display that was recently introduced to the market, contact your local response center. Previously released monitors from these recommended vendors are still supported.
- If you install other calibration software on your Mac computer, you will experience conflicts when performing calibration and when creating and accessing the monitor profile.
- While the NEC PA and EA series displays were previously on the recommended monitor list, they are no longer for sale. If you are currently using one of those displays, you can continue to use them, with the exception of the NEC EA271F, which is not supported (no uniformity correction).
- For the latest displays from Eizo, see the product Web site at <http://www.eizo.com/>.
