

# RBA rules and rule sets

RBA uses *rules* to automate processes in your Prinerger workflow.

An enabled rule waits for changes, or *events*, in your Prinerger job or system and automatically runs processes, or *actions*, that are associated with those events in the rule set.

For example, after a page is approved (the event), you can specify that a virtual proof be created (the action).

A rule always begins with an event that has occurred in Prinerger or other software. An action is connected to the event by a line in the RBA workspace.

When this event occurs		Do this action
		
Events are orange arrows.		Actions are blue squares.

The action results in further events, such as **Done**, **Success**, or **Error**. For example, when input files are added, refine them:
