# Create a remote sender event
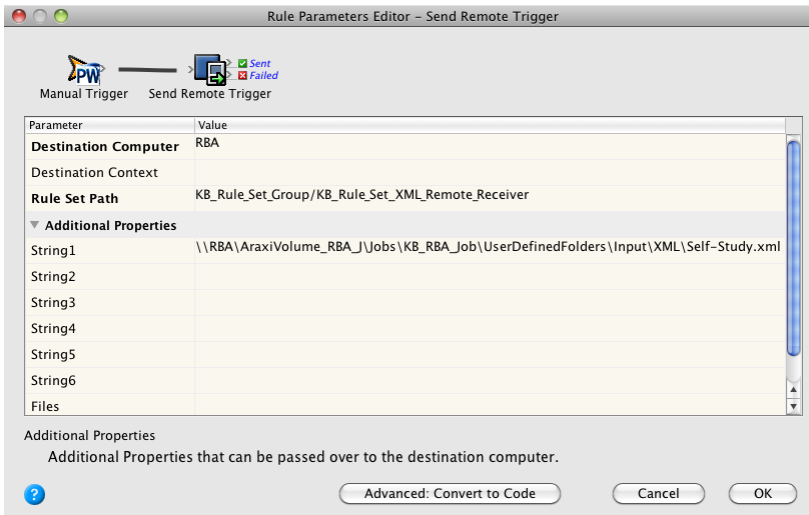

1. Create a new rule set called **<XX>_Rule_Set_XML_Remote_Sender** *(where <XX>* represents your initials) in **<XX>_Hub_Job**.
2. Add an exception handler rule, like you did in the previous rule set.
3. Add a **Manual Trigger** action.
4. Add a **Send Remote Trigger** action to the resulting event of the **Manual Trigger** action.

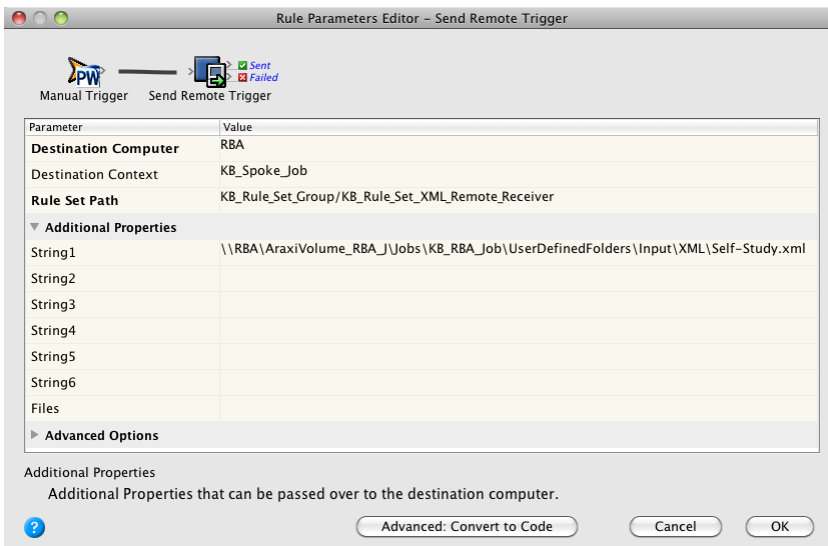

5. Configure the **Rule Set Path** parameter to your **<XX>_Rule_Set_Group** > **<XX> _Rule_Set_XML_Remote_Receiver**.
   This path must be accurate for the trigger to work.

6. Configure the **String1** parameter by entering the full path to the XML (intent) file that you have saved on your system.

7. Configure the **Destination Context** parameter by entering your spoke job name, **<XX>_Spoke_Job**.

8. Enable **<XX>_Rule_Set_XML_Remote_Sender** in **<XX>_Hub_Job**.
