

Preps profiles for the imposition workflow types

One sample Preps configuration profile for each of the automated imposition workflow types is included in the \AraxiPreps\Profiles folder. These profiles are based on the standard PrepsPrinergy profile. You can use them as is, or you can edit their criteria for signature matching.

Note:

- You can switch your profile selection in the ImportAll process template until you find the profile that gives the best results.
- By default, the optional signature-matching criteria are disabled in the sample profiles that are included with the Prinergy installation. You can edit the criteria to suit your needs.
- No spaces appear in the actual profile names, which is necessary for profiles.

JDF Match Then Create

This profile always first attempts to resolve signatures, and creates a signature only when unable to find a match. It uses these profile settings:

- -JDFNoResolveCreateOnly:NO
- -JDFResolveGenerateMissingSignatures:YES

JDF Match Only

This profile always attempts only to resolve signatures to an existing template, and never autocreates signatures. It uses these profile settings:

- -JDFNoResolveCreateOnly:NO
- -JDFResolveGenerateMissingSignatures:NO

JDF Create Only

This profile always autocreates the signatures and ignores any templates that are in the Templates folder. It uses these profile settings:

- -JDFNoResolveCreateOnly:YES
- -JDFResolveGenerateMissingSignatures:YES
