Tell me more about how Prinergy Evo combines colors

If, in the output template dialog box, **Render** section, **Spot Color Handling box**, you select **Convert to Process**, Prinergy Evo software converts spot colors to process when:

- Input files are composite
- All spot colors are set to opaque in the color database (if the spot color is not in the color database, opaque is assumed)

If the above conditions are not met, and if the input files contain overprinted spot colors, Prinergy Evo software automatically combines the layers and outputs the overprinted colors correctly.
