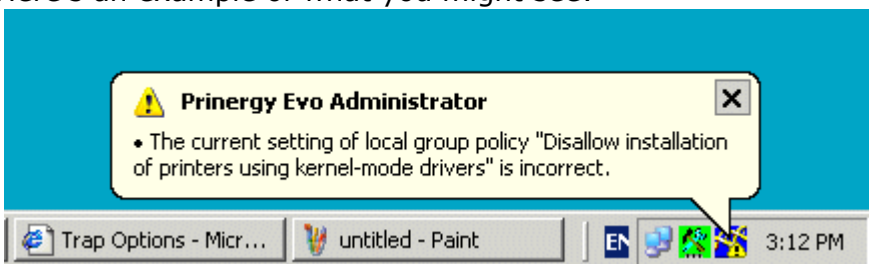
Fixing system settings on the Prinergy Evo server

Prinergy Evo software detects specific server configurations that prevent the program from working as designed. When Prinergy Evo software detects a problem in the Windows Server 2008 operating system, you will see an alert in the right-hand corner of your server's desktop. Here's an example of what you might see:



1. To fix the problem, start the Prinergy Evo Administrator, click the **Tools** tab, and then click **System Configurations**.
2. In the System Configurations dialog box, in the **Policy** area, click the problem setting listed.
   Prinergy Evo software provides more details about the problem and how to fix it.
3. Click **Fix All** if you want Prinergy Evo software to fix the problem for you.
   Alternatively, you can fix the problem yourself by following the directions in the **Suggested solution** area of the dialog box.
