Defining the default light source for PressProof (if licensed) 1

After the Prepress Portal 9.2 upgrade, the default light source that that will be used is D50. If you want to use a different light source, you will have to adjust the global settings. When surfaces are pre-rendered for PressProof, the correct light source information is utilized.

Set a default light source to ensure color accurate surfaces in PressProof.

This is a global setting. The light source you select here will be used by default by the entire PressProof system. You can, however, apply a different light source to specific jobs or surfaces. For more information, see the *PressProof System Administration Guides* in Partner Place.

1. On the home page, click **Configuration Settings**.
2. Select **PressProof**.
3. In the **Default Light Source** area, select a light source from the list.
4. Click **Update**.
